## INTRODUCTION

### 1.1 PLASMAS FOR FUSION

#### 1.1.1 Plasma Parameters

#### 1.1.2 Fusion Fuels

Fusion collectively refers to the class of nuclear reactions merging lighter nuclei into a single heavier element. While fusion reactions for elements lighter than iron are generally exothermic, the most common and readily attainable involve isotopes of hydrogen or helium, the most promising candidates for which are shown below.

Here D and T indicate nuclei of deuterium and tritium, two heavy isotopes of hydrogen (one proton plus one and two neutrons, respectively).

Pure deuterium fuel (reactions shown in eqs. 1-2) is attractive from a research standpoint, due to the abundance and ease of use of deuterium. Deuterium is a stable nucleus, obviating the need for radiation safety on the fuel system, and is naturally occurring in relative abundance (approximately 1/6000 of hydrogen nuclei on earth are

deuterium [cite](#)), allowing harvesting of deuterium fuel from seawater. However, pure-deuterium reactions suffer from low energy output per reaction [ref cross-section graphic](#) and a significantly lower reaction rate at feasible plasma conditions compared to other fuel options, setting high performance requirements for a putative DD-burning reactor.

## 1.2 MAGNETIC CONFINEMENT

### 1.2.1 *Basic Principles*

### 1.2.2 *Toroidal Configurations*

## 1.3 ALCATOR C-MOD

## 1.4 CONFINEMENT & TRANSPORT

### 1.4.1 *Global Confinement*

### 1.4.2 *Transport Barriers*

## 1.5 HIGH-PERFORMANCE REGIMES

### 1.5.1 *ELMy H-Mode*

### 1.5.2 *EDA H-Mode*

### 1.5.3 *I-Mode*

## 1.6 GOALS & OUTLINE

## COLOPHON

This document was typeset using `classicthesis` developed by André Miede (although aspects were changed to comply with the MIT thesis standards and the author’s personal preferences). The style was inspired by Robert Bringhurst’s seminal book on typography “*The Elements of Typographic Style*”. `classicthesis` is available for both  $\text{\LaTeX}$  and  $\text{\LyX}$ :

<http://code.google.com/p/classicthesis/>

*Final Version* as of December 24, 2013 (`classicthesis` version 4.1).

Hermann Zapf’s *Palatino* and *Euler* type faces (Type 1 PostScript fonts *URW Palladio L* and *FPL*) are used. The “typewriter” text is typeset in *FPL*, originally developed by Bitstream, Inc. as “Bitstream Vera”. (Type 1 PostScript fonts were made available by Malte Rosenau and Ulrich Dirr.)
